4. Tree Traversals
5. Heaps
6. Balanced Trees
7. Real-World Applications
8. Complexity Analysis
9. Summary

# Introduction to Trees

---

# What is a Tree?

---

**Definition:** A hierarchical data structure consisting of nodes connected by edges.

## Key Properties:

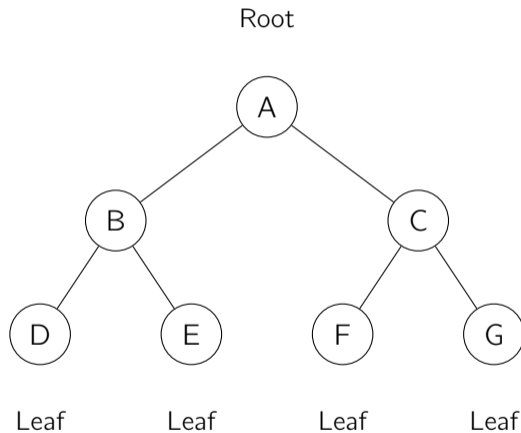

- Exactly one path between any two nodes
- One designated **root** node at the top
- No cycles (acyclic graph)
- Each node has zero or more **children**

## Tree Terminology:

- **Root:** The topmost node
- **Parent:** A node that has children
- **Child:** A node connected to a parent
- **Leaf:** A node with no children
- **Height:** Longest path from root to a leaf
- **Depth:** Distance from root to a node

# Basic Tree Structure

---

# Why Use Trees?

---

## Advantages:

- **Natural hierarchy:** File systems, organizational charts
- **Efficient search:**  $O(\log n)$  in balanced trees
- **Fast insertion/deletion:** Compared to sorted arrays
- **Flexible structure:** Adapts to different data patterns

## Common Applications:

- Database indexing (B-trees)
- File systems (directory trees)
- Expression parsing (syntax trees)
- Decision making (decision trees)
- Network routing
- Compression algorithms (Huffman trees)

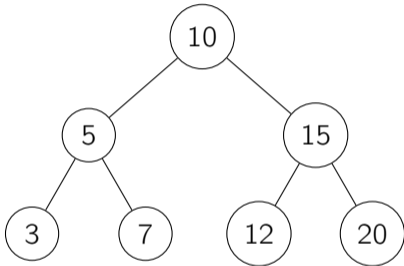

# Binary Trees

---

# Binary Trees

---

**Definition:** A tree where each node has at most two children (left and right).

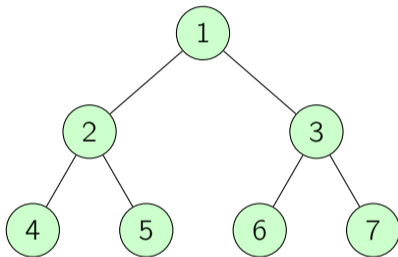

## Properties:

- Each node: at most 2 children
- Left child  $<$  Parent (in BST)
- Right child  $>$  Parent (in BST)

# Types of Binary Trees: Full Binary Tree

---

**Full Binary Tree:** Every node has either 0 or 2 children (no nodes with 1 child).

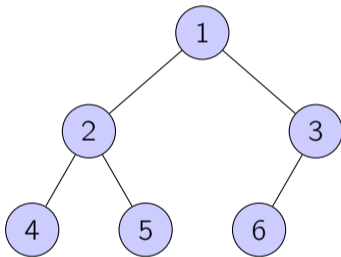

## Characteristics:

- All internal nodes have exactly 2 children
- All leaves at same or adjacent levels
- Useful for expression trees

# Types of Binary Trees: Complete Binary Tree

---

**Complete Binary Tree:** All levels filled except possibly the last, which is filled from left to right.

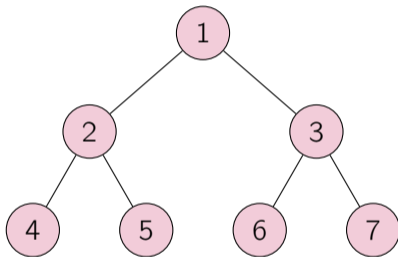

## Characteristics:

- Used in heap data structures
- Can be efficiently stored in arrays
- Left-to-right filling at each level

# Types of Binary Trees: Perfect Binary Tree

---

**Perfect Binary Tree:** All internal nodes have 2 children and all leaves are at the same level.

## Properties:

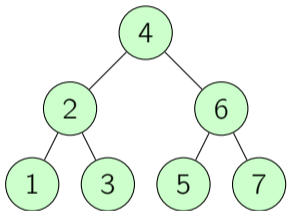

- Total nodes =  $2^{h+1} - 1$  ( $h$  = height)
- All leaves at level  $h$
- Maximally space-efficient

# Types of Binary Trees: Balanced vs Skewed

---

## Balanced Binary Tree

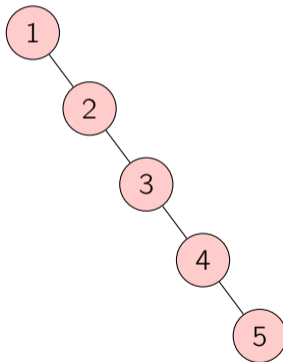

Height difference  $\leq 1$  for all nodes

**Height:**  $O(\log n)$

## Skewed Binary Tree

All nodes only have one child

**Height:**  $O(n)$

# Binary Tree Implementation

---

```
1 class TreeNode:
2     def __init__(self, value):
3         self.value = value
4         self.left = None
5         self.right = None
6
7 class BinaryTree:
8     def __init__(self):
9         self.root = None
10
11     def insert(self, value):
12         if not self.root:
13             self.root = TreeNode(value)
14         else:
15             self._insert_recursive(self.root, value)
16
17     def _insert_recursive(self, node, value):
```

# Binary Search Trees (BST)

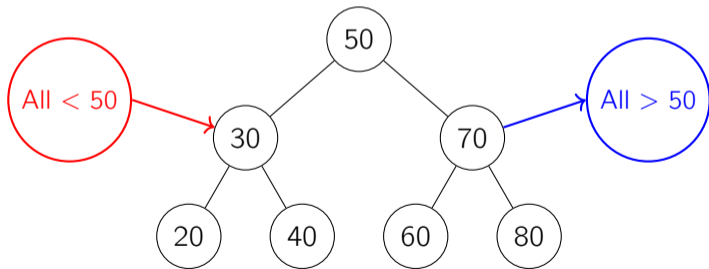

---

# Binary Search Tree (BST)

---

**Definition:** A binary tree where for every node:

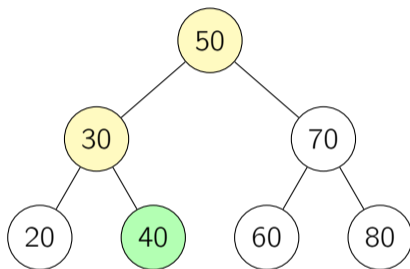

- All values in left subtree  $<$  node value
- All values in right subtree  $>$  node value
- Both subtrees are also BSTs

# BST Search Operation

---

**Algorithm:** Start at root and compare target with current node.

**Search for 40:**

1. Start at 50:  $40 < 50$  → go left

# BST Search Implementation

---

```
1 def search(self, value):
2     """Search for a value in the BST"""
3     return self._search_recursive(self.root, value)
4
5 def _search_recursive(self, node, value):
6     # Base case: empty tree or value found
7     if node is None or node.value == value:
8         return node
9
10    # Value is smaller: search left subtree
11    if value < node.value:
12        return self._search_recursive(node.left, value)
13
14    # Value is larger: search right subtree
15    return self._search_recursive(node.right, value)
16
17 # Iterative version
```

# BST Insert Operation

---

```
1 def insert(self, value):
2     """Insert a value into the BST"""
3     if not self.root:
4         self.root = TreeNode(value)
5     else:
6         self._insert_recursive(self.root, value)
7
8 def _insert_recursive(self, node, value):
9     # Insert in left subtree
10    if value < node.value:
11        if node.left is None:
12            node.left = TreeNode(value)
13        else:
14            self._insert_recursive(node.left, value)
15    # Insert in right subtree
16    else:
17        if node.right is None:
```

# BST Delete Operation: Three Cases

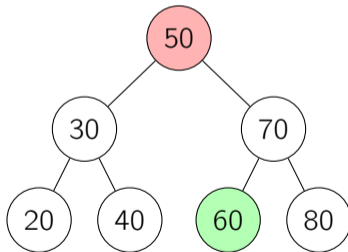

---

**Case 1: Node is a leaf** → Simply remove it

**Case 2: Node has one child** → Replace with child

**Case 3: Node has two children** → Replace with:

- **Inorder successor:** Smallest value in right subtree
- **Inorder predecessor:** Largest value in left subtree

# BST Delete Implementation

```
1 def delete(self, value):
2     self.root = self._delete_recursive(self.root, value)
3
4 def _delete_recursive(self, node, value):
5     if node is None:
6         return None
7
8     if value < node.value:
9         node.left = self._delete_recursive(node.left, value)
10    elif value > node.value:
11        node.right = self._delete_recursive(node.right, value)
12    else:
13        # Case 1: Leaf or one child
14        if node.left is None:
15            return node.right
16        if node.right is None:
17            return node.left
18
19        # Case 2: Two children - find inorder successor
```

# Tree Traversals

---

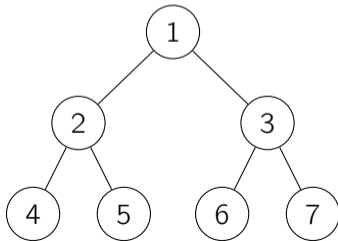

# Tree Traversal Overview

---

**Traversal:** Visiting all nodes in a specific order.

## Four Main Types:

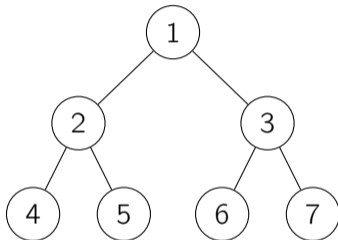

1. **Inorder (Left-Root-Right):** Produces sorted order in BST
2. **Preorder (Root-Left-Right):** Used for copying trees
3. **Postorder (Left-Right-Root):** Used for deleting trees
4. **Level-order (Breadth-first):** Level by level

# Inorder Traversal (Left-Root-Right)

---

**Order:** Left subtree  $\rightarrow$  Root  $\rightarrow$  Right subtree

**Result:** 4, 2, 5, 1, 6, 3, 7

## Use Cases:

- Getting sorted order from BST
- Expression tree evaluation

# Inorder Traversal Implementation

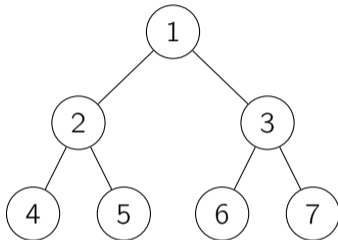

---

```
1 def inorder(self):
2     """Return list of values in inorder"""
3     result = []
4     self._inorder_recursive(self.root, result)
5     return result
6
7 def _inorder_recursive(self, node, result):
8     if node:
9         # Left subtree
10        self._inorder_recursive(node.left, result)
11        # Root
12        result.append(node.value)
13        # Right subtree
14        self._inorder_recursive(node.right, result)
15
16 # Iterative version using stack
17 def inorder_iterative(self):
```

# Preorder Traversal (Root-Left-Right)

---

**Order:** Root  $\rightarrow$  Left subtree  $\rightarrow$  Right subtree

**Result:** 1, 2, 4, 5, 3, 6, 7

## Use Cases:

- Creating a copy of the tree
- Prefix expression of an expression tree
- Serializing a tree

# Preorder Traversal Implementation

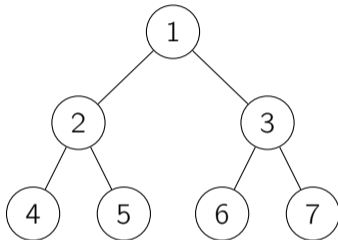

---

```
1 def preorder(self):
2     """Return list of values in preorder"""
3     result = []
4     self._preorder_recursive(self.root, result)
5     return result
6
7 def _preorder_recursive(self, node, result):
8     if node:
9         # Root
10        result.append(node.value)
11        # Left subtree
12        self._preorder_recursive(node.left, result)
13        # Right subtree
14        self._preorder_recursive(node.right, result)
15
16 # Iterative version
17 def preorder_iterative(self):
```

# Postorder Traversal (Left-Right-Root)

---

**Order:** Left subtree  $\rightarrow$  Right subtree  $\rightarrow$  Root

**Result:** 4, 5, 2, 6, 7, 3, 1

## Use Cases:

- Deleting a tree (delete children before parent)
- Postfix expression of an expression tree
- Computing directory sizes in file system

# Postorder Traversal Implementation

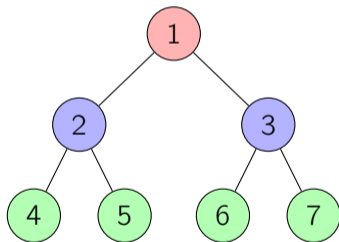

---

```
1 def postorder(self):
2     """Return list of values in postorder"""
3     result = []
4     self._postorder_recursive(self.root, result)
5     return result
6
7 def _postorder_recursive(self, node, result):
8     if node:
9         # Left subtree
10        self._postorder_recursive(node.left, result)
11        # Right subtree
12        self._postorder_recursive(node.right, result)
13        # Root
14        result.append(node.value)
15
16 # Iterative version using two stacks
17 def postorder_iterative(self):
```

# Level-Order Traversal (Breadth-First)

---

**Order:** Visit nodes level by level, left to right

Level 0: 1

Level 1: 2, 3

Level 2: 4, 5, 6, 7

**Result:** 1, 2, 3, 4, 5, 6, 7

## Use Cases:

- Finding shortest path in unweighted tree

# Level-Order Traversal Implementation

---

```
1 from collections import deque
2
3 def level_order(self):
4     """Return list of values in level-order"""
5     if not self.root:
6         return []
7
8     result = []
9     queue = deque([self.root])
10
11    while queue:
12        node = queue.popleft()
13        result.append(node.value)
14
15        if node.left:
16            queue.append(node.left)
17        if node.right:
```

# Heaps

---

# Heap Data Structure

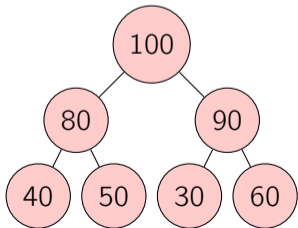

---

**Definition:** A complete binary tree satisfying the heap property.

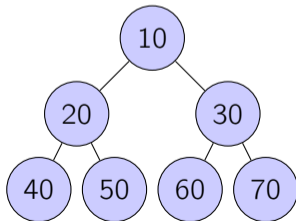

**Two Types:**

- **Max Heap:** Parent  $\geq$  children (root is maximum)
- **Min Heap:** Parent  $\leq$  children (root is minimum)

**Max Heap**

**Min Heap**

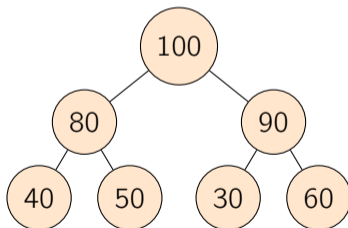

# Heap Array Representation

---

**Key Insight:** Complete binary tree can be stored efficiently in an array.

## Index Relationships:

- **Parent of  $i$ :**  $(i - 1)/2$
- **Left child of  $i$ :**  $2i + 1$
- **Right child of  $i$ :**  $2i + 2$

**Array:** [100, 80, 90, 40, 50, 30, 60]

**Indices:** 0 1 2 3 4 5 6

# Heap Insert Operation

---

## Algorithm:

1. Add new element at the end (maintain complete tree property)
2. **Heapify Up:** Compare with parent and swap if needed
3. Repeat until heap property restored

```
1 def insert(self, value):
2     """Insert value into max heap"""
3     self.heap.append(value)
4     self._heapify_up(len(self.heap) - 1)
5
6 def _heapify_up(self, index):
7     parent = (index - 1) // 2
8
9     # Max heap: if current > parent, swap
10    if index > 0 and self.heap[index] > self.heap[parent]:
11        self.heap[index], self.heap[parent] = \
12            self.heap[parent], self.heap[index]
```

# Heap Extract Max/Min Operation

---

## Algorithm:

1. Remove and return root (max/min element)
2. Replace root with last element
3. **Heapify Down:** Compare with children and swap with larger/smaller
4. Repeat until heap property restored

```
1 def extract_max(self):
2     if not self.heap:
3         return None
4
5     max_val = self.heap[0]
6     self.heap[0] = self.heap[-1]
7     self.heap.pop()
8     self._heapify_down(0)
9     return max_val
10
11 def _heapify_down(self, index):
12     largest = index
```

# Heap Applications

---

## Priority Queue:

- Task scheduling (OS process scheduling)
- Event-driven simulation
- Dijkstra's shortest path algorithm

## Heap Sort:

- Build max heap from array
- Repeatedly extract max
- $O(n \log n)$  time,  $O(1)$  space

## Top-K Problems:

- Find K largest/smallest elements
- Maintain min/max heap of size K
- Streaming data scenarios

## Median Finding:

- Two heaps: max heap for lower half, min heap for upper half

## Balanced Trees

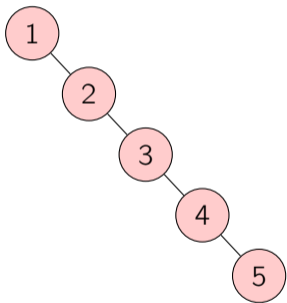

---

# Why Balanced Trees?

---

**Problem with BST:** Can degenerate to  $O(n)$  operations in worst case.

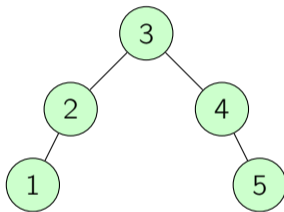

## Worst Case BST

Height =  $n$

Operations:  $O(n)$

## Balanced BST

Height =  $\log n$

Operations:  $O(\log n)$

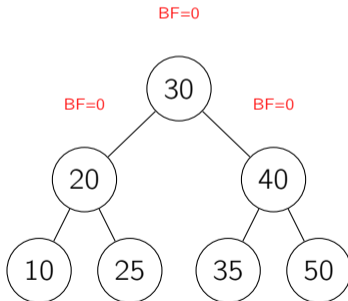

**Solution:** Self-balancing trees (AVL, Red-Black)

# AVL Trees

**Definition:** BST where height difference of left and right subtrees  $\leq 1$  for all nodes.

**Balance Factor:**  $\text{height}(\text{left}) - \text{height}(\text{right})$

- Must be -1, 0, or +1 for all nodes

**Properties:**

- Height is always  $O(\log n)$

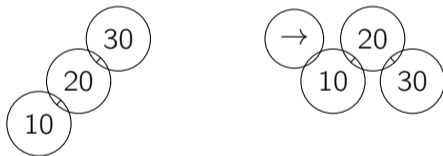

# AVL Tree Rotations

---

## Four Rotation Cases:

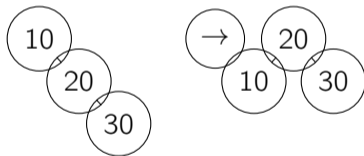

### 1. Left-Left (LL)

Single right rotation

### 2. Right-Right (RR)

Single left rotation

### 3. Left-Right (LR)

Left rotate, then right rotate

### 4. Right-Left (RL)

Right rotate, then left rotate

# AVL Tree Rotation Implementation

```
1 def _rotate_right(self, y):
2     """Right rotation"""
3     x = y.left
4     T2 = x.right
5
6     x.right = y
7     y.left = T2
8
9     y.height = 1 + max(self._get_height(y.left),
10                        self._get_height(y.right))
11     x.height = 1 + max(self._get_height(x.left),
12                        self._get_height(x.right))
13     return x
14
15 def _rotate_left(self, x):
16     """Left rotation"""
17     y = x.right
18     T2 = y.left
```

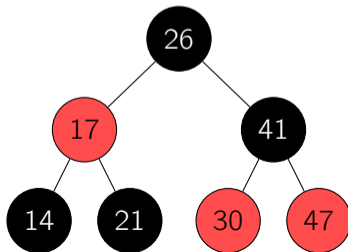

# Red-Black Trees

---

**Definition:** BST with additional color property for balancing.

**Properties:**

1. Every node is either red or black
2. Root is always black
3. All leaves (NIL) are black
4. Red nodes have black children (no two red nodes in a row)
5. All paths from root to leaves have same number of black nodes

# Red-Black Trees vs AVL Trees

---

Feature	AVL Tree	Red-Black Tree
Balance	Strictly balanced	Approximately balanced
Height	$\leq 1.44 \log n$	$\leq 2 \log n$
Search	Faster	Slightly slower
Insert/Delete	More rotations	Fewer rotations
Use case	Read-heavy	Insert/delete-heavy
Examples	Databases	Java TreeMap, C++ map

## Key Takeaway:

- AVL: Better for lookup-intensive applications
- Red-Black: Better for applications with frequent insertions/deletions

# Real-World Applications

---

# Database Indexing

---

**B-Trees and B+ Trees:** Variants of balanced trees used in databases.

## Why Trees for Databases?

- Fast search:  $O(\log n)$
- Efficient range queries
- Good disk I/O performance (nodes = disk blocks)
- Support for ordered traversal

## B+ Tree Features:

- All data in leaf nodes
- Internal nodes only store keys
- Leaves linked for sequential access
- Used in: MySQL, PostgreSQL, SQLite

## Example:

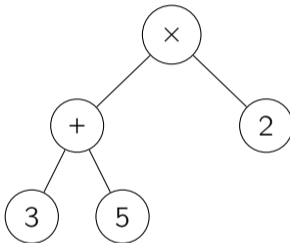

- Index on employee ID
- Fast lookups: `SELECT * WHERE id = 12345`

# Expression Parsing

---

**Syntax Trees:** Represent mathematical or code expressions.

**Example:**  $(3 + 5) \times 2$

**Evaluation:**

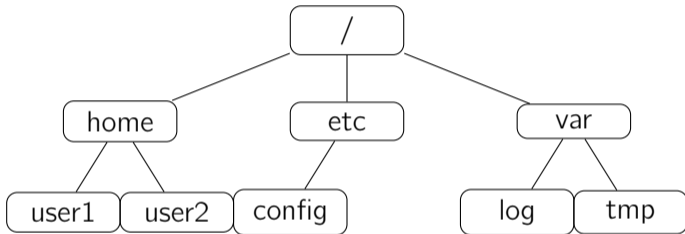

- Postorder traversal:  $3, 5, +, 2, \times$
- Result:  $(3 + 5) = 8$ , then  $8 \times 2 = 16$

**Applications:**

# File Systems

---

**Directory Structure:** Trees represent hierarchical file organization.

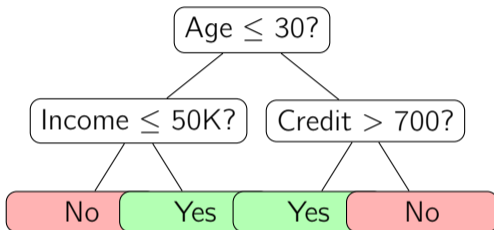

## Operations:

- Navigate directories:  $O(\text{depth})$
- List contents: Visit children
- Calculate directory size: Postorder traversal
- Search for files: DFS or BFS

# Decision Trees (Machine Learning)

---

**Decision Trees:** Tree-based models for classification and regression.

## Properties:

- Internal nodes: Decision rules
- Leaves: Predictions (class labels or values)
- Path from root to leaf: Decision path

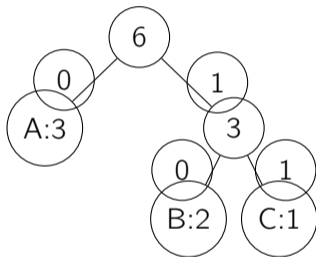

**Algorithms:** ID3, C4.5, CART, Random Forests, Gradient Boosting

# Huffman Coding (Compression)

---

**Huffman Tree:** Optimal prefix-free binary code for data compression.

**Example:** Compress "AAABBC"

**Encoding:**

- A: 0, B: 10, C: 11
- "AAABBC" → 0 0 0 10 10 11 (10 bits vs 18 bits)

**Used in:** ZIP, JPEG, MP3

# Complexity Analysis

---

# Tree Operations Complexity

---

Operation	BST (avg)	BST (worst)	Balanced
Search	$O(\log n)$	$O(n)$	$O(\log n)$
Insert	$O(\log n)$	$O(n)$	$O(\log n)$
Delete	$O(\log n)$	$O(n)$	$O(\log n)$
Find Min/Max	$O(\log n)$	$O(n)$	$O(\log n)$
Traversal	$O(n)$	$O(n)$	$O(n)$

## Key Points:

- Unbalanced BST: Worst case  $O(n)$  when tree becomes skewed
- Balanced trees (AVL, Red-Black): Guaranteed  $O(\log n)$
- Traversals always  $O(n)$  - must visit every node

# Heap Operations Complexity

---

Operation	Time Complexity
Insert	$O(\log n)$
Extract Max/Min	$O(\log n)$
Get Max/Min (peek)	$O(1)$
Build Heap	$O(n)$
Heapify	$O(\log n)$
Heap Sort	$O(n \log n)$

**Space Complexity:**  $O(n)$

**Note:**

- Get max/min is  $O(1)$  - root element
- Build heap from array is  $O(n)$ , not  $O(n \log n)$

# Space Complexity

---

## Tree Storage:

Structure	Space
Binary Tree (pointer-based)	$O(n)$
Complete Binary Tree (array)	$O(n)$
AVL Tree (with height)	$O(n)$
Red-Black Tree (with color)	$O(n)$
Heap (array-based)	$O(n)$

## Additional Space:

- Recursive traversals:  $O(h)$  stack space
- Iterative traversals with stack/queue:  $O(h)$  or  $O(w)$ 
  - $h$  = height,  $w$  = maximum width
- Level-order traversal:  $O(w)$  for queue

# Summary

---

# Key Concepts Recap

---

## Binary Trees:

- Hierarchical structure with at most 2 children per node
- Types: Full, Complete, Perfect, Balanced, Skewed

## Binary Search Trees:

- Ordered binary tree:  $\text{left} < \text{root} < \text{right}$
- Operations: Search, Insert, Delete -  $O(h)$
- Can degenerate to  $O(n)$  without balancing

## Traversals:

- Inorder (sorted), Preorder (copy), Postorder (delete), Level-order

## Heaps:

- Complete binary tree with heap property
- Priority queue, Heap sort, Top-K problems

# Key Concepts Recap (continued)

---

## Balanced Trees:

- AVL: Strict balance, faster search
- Red-Black: Approximate balance, faster insert/delete
- Both guarantee  $O(\log n)$  operations

## Applications:

- Database indexing (B-trees, B+ trees)
- Expression parsing (syntax trees)
- File systems (directory trees)
- Machine learning (decision trees)
- Compression (Huffman coding)

## Complexity:

- Balanced trees:  $O(\log n)$  for search, insert, delete
- Heaps:  $O(\log n)$  for insert/extract,  $O(1)$  for peek
- Traversals: Always  $O(n)$

# When to Use Which Tree?

---

Use Case	Tree Type
Fast search in sorted data	BST, AVL, Red-Black
Priority queue	Min/Max Heap
Frequent inserts/deletes	Red-Black Tree
Lookup-heavy workload	AVL Tree
Database indexing	B-Tree, B+ Tree
Expression evaluation	Syntax Tree
File system	N-ary Tree
Decision making	Decision Tree
Compression	Huffman Tree
Range queries	Segment Tree, Interval Tree

# Practice Problems

---

## Basic:

- Implement inorder, preorder, postorder traversals
- Find height of a binary tree
- Check if a binary tree is a valid BST
- Find lowest common ancestor (LCA)

## Intermediate:

- Serialize and deserialize a binary tree
- Convert sorted array to balanced BST
- Implement AVL tree with rotations
- Find kth smallest element in BST

## Advanced:

- Implement Red-Black tree
- Morris traversal (constant space)
- Segment tree for range queries
- Trie for prefix matching

# Next Steps

---

## Continue Learning:

- Advanced trees: Trie, Segment Tree, Fenwick Tree
- Graph algorithms (trees are special graphs)
- Dynamic programming with trees
- Practice on LeetCode, HackerRank

## Resources:

- CLRS: Introduction to Algorithms
- GeeksforGeeks tree tutorials
- Visualgo.net for visualizations
- Project: Implement your own balanced tree library

## Real-World Projects:

- Build a simple database with B-tree indexing
- Create an expression evaluator
- Implement file compression with Huffman coding
- Design a decision tree classifier
